※1. Interference of coexisting ion (selectivity coefficient for 0.1 mol/L ion concentration)

If an ion coexists in the solution, it can cause data errors when measuring the targeted ion.

"A selectivity coefficient of 10x means that if the solution contains a coexistent ion that is 10 times greater than the value of the targeted ion that is measured, an error occurs in which the value of the targeted ion equals the coexistent ion value."

"If the concentration level of the coexistent ion is high enough to affect the measured values, we recommend conducting pretreatment in order to prevent interference."

The ion sensor portion is a "Tip-Replaceable Electrode" (except membrane electrode) Lead length is 1 m (standard)

※2. 1143A279 (TISAB-01) : For general sample 143A280 (TISAB-11) : For sample containing metal ion (iron, aluminum etc.)

Note 1) The ion electrode does not have temperature measurement function. Measurable solution temperature range is 0-50 °C.

Note 2) The batch measurement method is primarily used to conduct ion measurements. This method is conducted after sampling, which uses beakers and other apparatuses.

In addition to the electrode, standard solution, ion strength adjuster, reference electrode external solution, and Electrode Holder/Stand are necessary for ion measurement.

Note 3) Make sure to contact us before you conduct ion measurements, because when there are coexisting samples, it can be difficult to conduct ion measurements.

Note 4) We do not sell cyanide, silver, and sulfide ion standard solutions. Customers are suggested to prepare following the steps listed in the instruction manual.
